7.2 Introduction

This Testing and Monitoring Plan describes how Bayou Bend CCS LLC (Operator) will monitor the Bayou Bend East SL20220050 – Phase 1 (BBE-P1) site, **Claimed as PBI** [REDACTED], pursuant to 40 CFR 146.90. In addition to demonstrating that the wells are operating as planned and the CO₂ saturation and pressure front are moving as predicted, the monitoring data will be used to validate and adjust the reservoir simulation models used to predict the distribution of the CO₂ within the injection zone to support Area of Review (AOR) reevaluations and a non-endangerment demonstration.

25 Results of the testing and monitoring activities described below may trigger action according to the
26 Emergency and Remedial Response Plan (ERRP).

7.3 Overall Strategy and Approach for Testing and Monitoring

7.3.1 Testing and Monitoring Plan Objectives

The Operator has developed a comprehensive Testing and Monitoring Plan to assess **Claimed as PBI**

Claimed as PBI

1 Plan revision number: 0

2 Plan revision date: June 2024

3 The direct and indirect testing and monitoring tracking proposed methods to be used at BBE-P1 and
4 required per 40 CFR 146.90(g)(1) and (2) are provided in **Table 7-1**. These methods are discussed in the
5 following sections.

4 **Claimed as PBI**

5 **7.3.2 Testing and Monitoring Plan Focus Areas**

6 **Claimed as PBI**

Plan revision number: 0
Plan revision date: June 2024

Claimed as PBI

Plan revision number: 0

Plan revision date: June 2024

Claimed as PBI

7.3.3 Monitoring Network Design and Strategy

Figure 7-2 below is a schematic diagram illustrating the monitoring plan that the Operator will deploy at

Claimed as PBI

Table 7-2 provides a list of monitoring techniques and their frequency during the different stages of the project. The following sections provide additional details on each methodology.

Plan revision number: 0
Plan revision date: June 2024

Claimed as PBI

Table 7-2: Summary of monitoring methodologies and monitoring frequencies for baseline and injection phases.

Monitoring Category	Monitoring Method		Baseline Frequency (1 year)	Injection Phase Frequency (20 years)*
Monitoring Plan Update	Reviewed every 5 years; Updated as required		N/A	As required
CO ₂ Injection Stream Analysis	Monitoring of injection stream chemical composition		N/A	Quarterly
CO ₂ Injection Process Monitoring	Continuous monitoring of injection process (e.g., injection rate, pressure, and temperature; annulus pressure)		N/A	Continuous
Hydrogeologic Testing	Injection well pressure fall-off testing		1 after well completion	1 per every 5 years
Injection Well Mechanical Integrity Testing	<i>Internal</i> **	Continuous annulus pressure monitoring of pressurized annulus	1 after well completion	Continuous
	<i>External</i> **	Claimed as PBI [REDACTED]	1 after well completion	Annual
Corrosion Monitoring	Corrosion coupons (well and pipeline materials)		N/A	Quarterly

Claimed as PBI

*Monitoring technologies and reporting frequencies provided in this permit may change, pursuant to UIC Program Director approval based on monitoring data, technology, well/equipment failures, and/or regulatory changes.

**Internal integrity tests refer to annular space and pressure monitoring. External integrity tests refer to casing and temperature logging.

Plan revision number: 0
Plan revision date: June 2024

1 **7.3.4 *Quality assurance procedures***

2 A quality assurance and surveillance plan (QASP) for testing and monitoring activities, required pursuant
3 to 40 CFR 146.90(k), is provided in **Appendix 7-1**.

4 **7.3.5 *Reporting procedures***

5 The Operator will provide testing and monitoring results to the UIC Program Director in compliance with
6 the requirements under 40 CFR 146.91.

7 **7.4 Carbon Dioxide Stream Analysis [40 CFR 146.90(a)]**

8 The CO₂ stream will be analyzed during the operation phase to yield data representative of its chemical and
9 physical characteristics and to meet the requirements of 40 CFR 146.90(a).

10 **7.4.1 *Sampling location and frequency***

11 **Claimed as PBI**

12 **Claimed as PBI**

13 No other equipment will affect the CO₂ stream at this point, so the analyzer
14 will be exposed to the same CO₂ stream as the wellhead, any downhole equipment, and formation solids
15 and fluids. Physical samples of the gas will also periodically be taken and sent to a qualified laboratory.

16 Baseline data will be collected quarterly during the first year of injection. No significant changes are
17 anticipated in the CO₂ stream throughout the injection period. However, if significant changes are detected
18 by monitoring equipment, the Operator will make the appropriate operational actions, including but not
19 limited to, collecting laboratory samples, and temporarily shutting in the facility. The operating Central
20 Gathering Facility procedures will outline a plan to identify the cause of the change, assess the impact on
21 the project, and implement corrective actions.

22 **Claimed as PBI**

23 **Claimed as PBI**

24 **7.4.2 *Analytical parameters***

25 The Operator will analyze the CO₂ for the constituents identified in **Table 7-3** using the methods listed.

Claimed as PBI

Claimed as PBI

1 7.4.3 *Sampling methods*

2 Samples of the CO₂ stream will be collected downstream of the process equipment, at the beginning of the
3 pipeline to the wellhead. This will ensure that the samples are the same CO₂ composition and pressures that
4 will be injected. Samples will be collected in gas cylinders, or equivalent.

5 7.4.4 *Laboratory to be used/chain of custody and analysis procedures*

6 CO₂ stream samples will be collected in gas cylinders, or equivalent, and sent to a qualified laboratory for
7 analysis of the parameters (**Appendix 7-1**). A standardized chain-of-custody form will be used to track the
8 samples from collection to disposal. A copy of the form will be provided to the person or qualified
9 laboratory receiving the samples as well as the person or qualified laboratory transferring the samples.
10 These forms will allow for easy tracking of sample status and will be archived. Detailed instructions on
11 sampling processes, including sample collection, handling, transportation, analysis, and disposal are
12 provided in the QASP (**Appendix 7-1**).

13 7.5 **Continuous Recording of Operational Parameters [40 CFR 146.88I(1), 146.89(b) and 14 146.90(b)]**

15 The Operator will install and use on each injector continuous recording devices to monitor injection
16 pressure, rate, and volume; the pressure on the annulus between the tubing and the long string casing; the
17 annulus fluid volume added; and the temperature of the CO₂ stream, as required at 40 CFR 146.88I(1),
18 146.89(b), and 146.90(b).

19 7.5.1 *Monitoring location and frequency*

20 The Operator will perform the activities identified in **Claimed as PBI** on each injector well to monitor operational
21 parameters and verify internal mechanical integrity of the injection well. Monitoring will take place at the
22 locations and frequencies shown in the table.

23 If an anomaly occurs within one of the operating parameters below, available data will be interrogated to
24 determine the most plausible cause of the anomaly and inform any next steps to be taken by the Operator.

25 **Claimed as PBI**

26 **Claimed as PBI**

Plan revision number: 0

Plan revision date: June 2024

Claimed as PBI

1 **7.5.2 Monitoring details**

2 *Continuous Recording of Wellhead Injection Pressure and Temperature*

3 The CO₂ injection pressure and temperature will be monitored on a continuous basis at each wellhead to
4 ensure that injection pressures do not exceed the calculated maximum allowable injection pressure (MAIP)
5 [Narrative, Table 7-1], determined, in part, by using 90% of the fracture pressure of the injection zone per
6 40 CFR146.88 (a).

7 *Continuous Recording of Injection Rate*

8 The rate of CO₂ injection into the wells will be monitored by flowmeters located on the injection piping at
9 each injector wellhead, upstream of the choke. The flowmeters will be connected to the Supervisory Control
10 and Data Acquisition (SCADA) system for continuous monitoring and control of the CO₂ injection rate into
11 each well.

12 *Injection Volume*

13 The injection volume into the reservoir will be calculated on a continuous basis based on the injection mass.
14 The pressure and temperature conditions will be accounted for at the measurement. The volume calculated
15 will be used in the computational models to determine storage capacity, flow within the reservoir, and
16 volumes sequestered.

17 *Continuous Recording of Annular Pressure*

18 As described in the Pre-Operational Testing Plan [Section 6.5], the annular pressure will be tested prior to
19 operation by conducting an internal mechanical integrity test. During operations, the pressure on the
20 annulus between the injection tubing and the long-string casing will be measured continuously by an
21 electronic pressure gauge mounted on wellhead. The gauge will be connected to the well control system
22 and the SCADA system to monitor the annular pressure.

23 *Recording of Annulus Fluid Volume*

24 The volume of the annulus fluid between the injection tubing and the long-string casing will be calculated
25 and confirmed during well construction. The annular pressure is expected to fluctuate as atmospheric and
26 injection stream temperatures change during startup, injection, and shutdown operations. The fluid will be
27 added to or removed from the annulus to maintain the pressure higher than the CO₂ injection surface
28 injection pressures. If fluid volumes must be added or removed to maintain annular pressure during
29 injection, those volumes will be recorded and submitted to the Underground Injection Control (UIC)
30 Program Director.

31 *Continuous Recording of CO₂ Stream Temperature*

32 The temperature of the CO₂ injection stream will be continuously measured using an electronic temperature
33 gauge. The gauge will be mounted to the injection piping at each wellhead and will be electronically
34 connected to the SCADA system. The gauge will be calibrated prior to the start of injection operations and

Plan revision number: 0

Plan revision date: June 2024

1 calibrated annually. The thermocouple for measuring surface injection temperature will be recalibrated
2 annually or it will be replaced with a calibrated thermocouple.

3 **7.6 Corrosion Monitoring**

4 To meet the requirements of 40 CFR 146.90(c), the Operator will monitor well materials during the
5 operation phase for loss of mass, thickness, cracking, pitting, and other signs of corrosion to ensure that the
6 well components meet the minimum standards for material strength and performance.

7 The Operator will monitor corrosion using corrosion coupons. Collection and analysis of samples will be
8 done according to the description below.

9 **7.6.1 Monitoring location and frequency**

10 Corrosion coupons composed of the same material as the well components be placed in discharge piping
11 of the Central Gathering Facility that will go into the injection pipeline. The coupons will be exposed to the
12 same fluid that will be injected into the well. The coupons will be checked on a quarterly basis for signs of
13 corrosion for the first year after injection; sampling beyond that will be determined from initial results
14 and/or industry preferences. Coupons could be checked more frequently if there are operational concerns
15 or other factors that change during injection.

16 Coupons will be checked for loss of mass, thickness, cracking, pitting, and other signs of corrosion that
17 may be indicative of future potential integrity issues. If signs of corrosion are identified in the coupons, this
18 will trigger further well integrity testing.

19 **7.6.2 Sample description**

20 **Table 7-5** below is the list of well construction components and material of construction. There will be a
21 corrosion coupon for each unique material.

22 **Claimed as PBI**

23 **7.6.3 Monitoring details**

24 The corrosion monitoring system will be located downstream of the injection pumps onshore, at the
25 beginning of the pipeline to the wellhead. Each material sample will be attached to a separate holder and

inserted into a flow-through pipe arrangement continuously during operation. This will ensure that the samples are exposed to the same CO₂ composition that will be seen at the wellhead and injection tubing; temperatures and pressures will be comparable to those at the wellhead. The holders and location of the system will be included in the Central Gathering Facility design and will allow for continued injection during sample removal.

At the frequency outlined in Section 7.6.1, each coupon will be carefully examined and measured to assess the extent of corrosion, following a standardized procedure. Each coupon will be photographed, visually inspected, dimensionally measured to within 0.0001 inches, and weighed to within 0.0001 grams, following the American Society for Testing and Materials (ASTM) G1-03 Standard Practice for Preparing, Cleaning, and Evaluating Corrosion Test Specimens (Re-approved 2017).

7.7 Above Confining Zone Monitoring

The Operator will monitor ground water quality and geochemical changes above the confining zone during the operation phase to meet the requirements of 40 CFR 146.90(d).

7.7.1 Monitoring location and frequency

Table 7-6 shows the planned monitoring methods, locations, and frequencies for ground water quality and geochemical monitoring above the confining zone.

Claimed as PBI

1 **7.7.2 Analytical parameters**

2 **Table 7-7** identifies the parameters to be monitored and the analytical methods Operator will use.

3 An extensive suite of groundwater parameters will be analyzed quarterly for up to one year prior to the start
4 of injection to capture natural seasonal variability. This suite includes natural intrinsic tracers such as ions,
5 dissolved gases, and isotopes that can be used to determine whether a foreign brine or gas has invaded the
6 groundwater.

7 After the start of injection, a shorter suite of groundwater parameters will be analyzed once every two years
8 or as needed. An evaluation of the results from the baseline data collection will be used to inform which
9 parameters will be included in this shorter suite. However, the shorter suite will likely include the
10 parameters listed in the “During and Post-injection” section of **Table 7-7**.

11 The range of concentrations measured during the baseline period will be used to evaluate geochemical
12 changes in the groundwater once injection begins. Geochemical measurements are influenced by a variety
13 of factors including natural and offset industry-induced fluctuations in the groundwater as variability due
14 to sampling and laboratory procedures. For these reasons, multiple sources of evidence are needed to
15 evaluate whether a change has occurred.

16 Mercury will be analyzed during baseline, but low detections should be considered suspect due to potential
17 contamination from the well casing or during sampling. Zinc will also be analyzed during baseline as it is
18 commonly found in tubing and pipe dope, and there is potential for sample contamination.

19 Once the project has established baseline conditions, monitoring may be reduced to a subset of analytes
20 that are most likely to change due to interactions with CO₂. Any modification to the parameter list in **Table**
21 **7-7** will be made in consultation with the UIC Program Director.

1 **7.7.3 Sampling methods**

2 Sampling will be performed in accordance with the QASP (Appendix 7-1). **Claimed as PBI**

3 **Claimed as PBI**

4 Field measurements for pH, temperature, conductance, and dissolved oxygen will be monitored and
5 recorded. Samples will be preserved and sent to the qualified laboratory via the chain of custody procedures
6 (Appendix 7-1).

7 **7.7.4 Laboratory to be used/chain of custody procedures**

8 The geochemical analyses and the isotopic analyses will be performed by qualified laboratories that meet
9 the standards and guidelines set forth in the QASP (Appendix 7-1). Samples will be tracked using
10 appropriately formatted chain-of-custody forms.

11 **7.8 External Mechanical Integrity Testing**

12 The Operator will conduct at least one of the tests presented in **Table 7-8** periodically during the injection
13 phase to verify external mechanical integrity as required at 40 CFR146.89(c) and 146.90(e). In combination
14 with the robust well and barrier design (Ref: Narrative 5.2.2 Well Design), MITs will verify no significant
15 fluid movement is observed through channels adjacent to the injection well bore.

16 **7.8.1 Testing location and frequency**

17 **Claimed as PBI**

1 Claimed as PBI

2 The mechanical integrity testing frequency reduction time will be proposed to the UIC Program Director
3 after baseline and historical data demonstrate a satisfactory trend.

4 **7.8.2 *Testing & Monitoring details***

5 Claimed as PBI

6 Regarding additional well data, injector well testing and evaluation will, at a minimum, be capable of
7 monitoring surface tubing and annular pressures and temperatures to identify any anomalies or possible
8 leaks (**Table 7-3**).

9 **7.8.3 *External MIT via logging***

10 The preliminary testing procedures for the wireline well logs in **Table 7-8** will follow Operator and industry
11 standards. The procedures will be approved by the UIC Program Director prior to commencing MIT
12 operations.

13 The following procedure will be used for logging:

- 14 1. If necessary, shut in well to allow for wellbore stabilization.
- 15 2. Move in and rig up wireline unit and pressure control equipment.
- 16 3. Run the log by lowering the tool from surface to the injection zone at a rate meeting the logging
17 tool performance specifications.
- 18 4. Pull the logging tool from the injection interval to surface to take readings at defined locations or
19 full wellbore in agreement with the UIC Program Director.
- 20 5. Perform repeat passes, as necessary, to provide wellbore coverage.
- 21 6. Rig down and move out wireline unit.
- 22 7. Log results will be interpreted and submitted to the UIC Program Director.

Plan revision number: 0

Plan revision date: June 2024

1 7.9 Pressure Fall-Off Testing

2 The Operator will perform pressure fall-off tests during the injection phase as described below to meet the
3 requirements of 40 CFR 146.90(f).

4 7.9.1 Testing location and frequency

5 A pressure fall-off test is planned for, at a minimum, once every five (5) years on each operational injection
6 well and at the end of the injection period. Results of the pressure fall-off tests will be submitted to the UIC
7 Program Director electronically within 30 days of the test. The pressure fall-off testing procedure is
8 described below.

9 7.9.2 Testing details

10 Operator will perform pressure fall-off testing with the procedure below.

- 11 Hold injection rate constant while maintaining as stable operating conditions as possible prior to
12 the fall-off test shut in period. Do not exceed the maximum operating pressure.
- 13 Shut in well at the wellhead, or as near to the wellhead as feasible. For offset injectors in Claimed as PBI
14 Claimed as PBI maintain a constant injection rate and continuously record injection rates for the duration
15 of the test.
- 16 Continuously measure pressure using downhole pressure gauges for the duration of the test.
17 Conduct the test over a sufficient time period in which pressure is no longer influenced by wellbore
18 storage or skin.

19 7.10 Carbon Dioxide Saturation Front and Pressure Front Tracking

20 The Operator will employ direct and indirect methods to track the extent of the CO₂ saturation front and the
21 presence or absence of elevated pressure during the operation phase to meet the requirements of 40 CFR
22 146.90(g) (**Table 7-1**).

23 7.10.1 Saturation front monitoring location and frequency

24 **Table 7-9** presents the methods that the Operator will use to monitor the position of the CO₂ saturation front,
25 including the activities, locations, and frequencies. The parameters to be analyzed as part of fluid
26 sampling in the injection zone and associated analytical methods are presented in **Table 7-10**. Quality
27 assurance procedures for these methods are presented in the QASP (Appendix 7-1).

28 **Claimed as PBI**

32 Due to the shallow water depths, the Operator has determined Claimed as PBI

Claimed as PBI	
Total Alkalinity	SM 2320B
Organic Acids (Acetate, Propionate, Butyrate)	APHA SM 5560B
Dissolved sulfide	SM4500
lab pH (25°C)	SM 4500 H+B
Total Dissolved Solids	SM 2540C
Water Density	Density Meter (ASTM D4052/D5002)
Conductivity	U.S. EPA Method 120.1 (Same as APHA SM 2510B and ASTM D1125-95(A)).
Turbidity (lab)	U.S. EPA Method 180.1 (Same as APHA SM 2130B)
Temperature (field)	Field instrument
Dissolved Inorganic Carbon (DIC)*	Standard Method 5310B
d ¹³ C Dissolved Inorganic Carbon	Gas Bench/CF-IRMS
dD & d ¹⁸ O H ₂ O	Analyzed via CRDS
Hydrogen sulfide	ASTM D5623
Cations: Al, Ba, Mn, As, Cd, Cr, Cu, Pb, Sb, Se, Sr, Tl, Zn, Ca, Fe, K, Mg, Na, Si, B, S	ICP-MS, EPA Method 6020B, ICP, EPA Method 6010D
Anions: Br, Cl, F, NO ₃ , NO ₂ , SO ₄ and PO ₄	Ion chromatography, EPA Method 300.0
δ ¹³ C of dissolved Methane, Ethane, Propane, and CO ₂ , δ ² H of Methane	High precision (offline) analysis via Dual Inlet IRMS
Dissolved CO ₂ , N ₂ , Ar, He, O ₂ , C1 – C6+ by headspace	Lab in-house SOP, similar to RSK-175

Plan revision number: 0
Plan revision date: June 2024

1 **7.10.3 Pressure-front monitoring location and frequency**

2 **Table 7-11** presents the methods that Operator will use to monitor the position of the pressure front,
3 including the activities, locations, and frequencies Operator will employ (**Appendix 7-1**)

4 The pressure front will be monitored **Claimed as PBI**

5 **Claimed as PBI**

6 **7.10.4 Pressure-front monitoring details**

7 **Claimed as PBI**

8 **Table 7-11.** Pressure-front monitoring activities.

Target Formation	Monitoring Activity	Monitoring Location(s)	Spatial Coverage	Frequency
DIRECT PRESSURE-FRONT MONITORING				

9 **Claimed as PBI**

10 **7.11 Appendix: Quality Assurance and Surveillance Plan**

11 The Quality Assurance and Surveillance Plan for the Testing and Monitoring Plan is provided in **Appendix**
12 **7-1.**

Plan revision number: 0

Plan revision date: June 2024

7.12 Additional Information

7.12.1 Acronyms

Claimed as PBI

AOR	Area of Review
ASTM	American Society for Testing and Materials
BBE-P1	Bayou Bend East SL20220050 – Phase 1
CCS	carbon transport and sequestration
CO ₂	carbon dioxide

Claimed as PBI

ERRP	Emergency and Remedial Response Plan
ft	feet
FWI	full waveform inversion

Claimed as PBI

MAIP	Maximum allowable injection pressure
MIT	mechanical integrity testing
OBS	ocean bottom sensors
PDHG	permanent downhole gauges

Claimed as PBI

QASP	quality assurance and surveillance plan
SCADA	Supervisory Control and Data Acquisition
TL	time-lapse
TVD	true vertical depth
UIC	Underground Injection Control

Claimed as PBI
